

Component Lab

1. Create two new Components one manually and other one using CLI: WarningAlert and SuccessAlert
2. Include them inside the AppComponent one after another.
3. Output a warning or success message in the Components.
4. Use templateUrl for one component and template for other for displaying the message
5. Style the Components appropriately (e.g. font color red/ green text, include padding, margin, border etc.)
6. Use external or internal templates and styles!
7. Feel free to create more components, nest them into each other or play around with different types of selectors!
